Document Detective
Protecting National Security Information

Review and sanitize documents with confidence

Document Detective is an interactive, desktop application designed for reviewing and sanitizing electronic documents, effectively meeting the Government's '100% reliable human review' criteria. This application is essential for Assured File Transfers' (AFT), the process of transferring files across security boundaries in their native format, from higher to lower classified networks or domains. Additionally, Document Detective is also effective to identify and mitigate Insider Threat signatures in electronic documents.

Features

Using multiple tools including keyword search, object and image inspection, optical character recognition (OCR) and a proven sanitization process, Document Detective reveals sensitive information that may be missed without a deep and careful review. It also provides Flatten Document functionality to assist in the cleanup of Word, Excel, and PowerPoint files in order to address vulnerabilities in those file types specifically.

- **Three-Step Sanitization Process** – Consists of Evaluate, Edit, & Validate modes, ensuring comprehensive document review and sanitization.

- **Keyword Search + Optical Character Recognition (OCR)** – Leverages keyword search engine dtSearch to create customizable keyword lists including Regular Expressions for scanning documents and identifying sensitive information. Document Detective also includes software based on Google's Tessaract3 OCR technology to recognize characters or text within images.

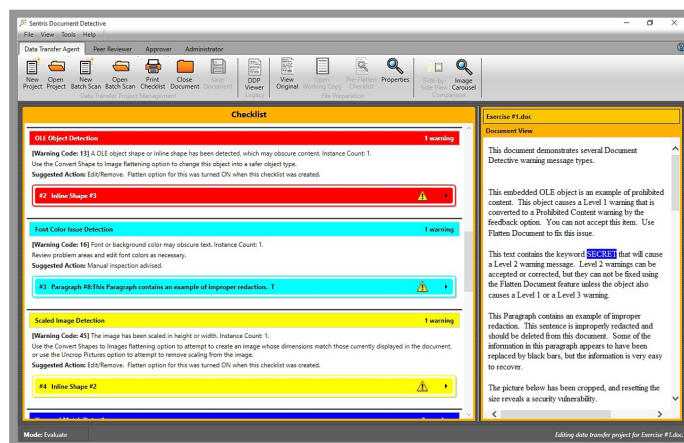

- **Document Flattening** – Perform object tests on Microsoft Office file types (Word, Excel, and PowerPoint) to identify security risks or content that should be reviewed. Flattening takes objects of a less secure type and attempts to transform them into visually equivalent objects of a safer type.

- **Insider Threat Mitigation** - Several features are included in Document Detective to help organizations identify Insider Threat signatures such as Keyword

List & Archive Package signing, and Windows Event Log Entries.

- **User Roles** – Define roles such as Data Transfer Agent (DTA), Peer Reviewer, Approver, and Administrator, each with distinct responsibilities. The software was designed with these roles in mind and can be configured to limit certain functionality, such as transfer approval, to users with the Approver role assigned.
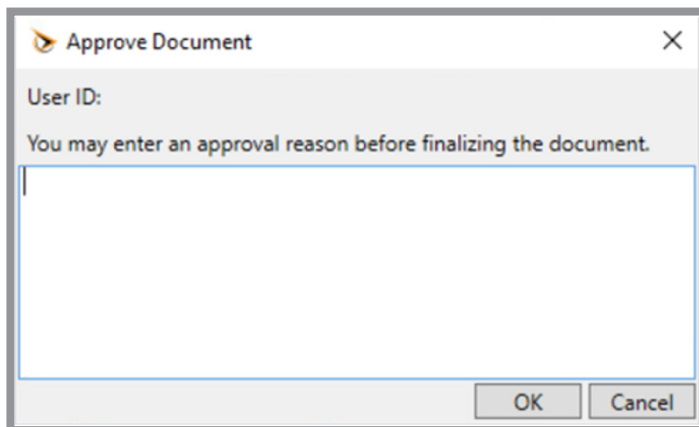

- **Archive Package** – Create a secure record of sanitization actions performed.

- **Batch Document Scanning** - Allows simultaneous scanning of multiple files and folders.
- **Supported File Types** – Document Detective supports a wide range of file types, including Microsoft Office files (Word, Excel, PowerPoint), image files, text files, sound files, and Adobe Acrobat files.

Instructor Led Training

Individuals or groups charged with protecting data are strongly encouraged to attend a formal Instructor-Led Training session to ensure that Data Transfer Agents (DTAs) are certified in the use of Document Detective. The certification provides fundamental understanding of the product capabilities, as well as how users and organizations can leverage the product to provide a record of action should the threat of a spill arise in the future.
